

New Protocol and Products for Anti-Aging and Skincare Professionals Announced

TBI, Inc. has announced protocol in cooperation with a new genetically engineered human protein that replaces up to two years of lost elastin in the first treatment. The 45 minute treatment uses TBI's Chiro950™ or BI Model 900 Microcurrent units and professional grade Dermalastyl®.

Colleyville, TX, December 04, 2008 --(PR.com)-- Medical science has previously confirmed the inability of the body to make the protein elastin after 12 years of age and the supply actually diminishes as we grow older. The loss of the protein impacts the ability of the body to sustain deep hydration and elasticity resulting in flabby skin, wrinkles and lines.

TBI's protocol is known as "Maximum Cosmetic Recovery" (MCR) using the natural healing abilities of Microcurrent and MCR with Dermalastyl®, a new Microcurrent conducting cream for professionals only. The protocol using Microcurrent and unique products combine to compliment and create the most advanced non-invasive treatment available. Dermalastyl® active ingredients include the following:

Elastatropin® (Tropoelastin) developed as part of the Department of Defense agency DARPA initially discovered in competition on wound healing and tissue regeneration to help treat battlefield injuries.

Matrixyl-3000® to promote collagen production, Argireline® a unique new peptide to decrease depth of facial wrinkles. Targeting the same wrinkles as Botox® but safely and with much less expense.

Hyaluronic Acid HA the active ingredient in Restylane® typically administered by injection at \$300 to \$500 per 10mg of HA. The MCR products contain up to 3500mg equal to 350 injections in a non-invasive painless protocol.

Proliesl® a mixture of amino acids with a powerful ability to reduce damage caused by sun exposure. Studies have proven the vital amino acids significantly reduce cell damage and programmed cell death caused by exposure to UV light.

TBI provides Microcurrent equipment, training and enhancing product protocols to MDs, Chiropractors, Spa Owners and other skincare professionals. TBI is the exclusive source of protocol and products for Microcurrent Elastin Infusion Therapy® and MCR with Dermalastyl® .

TBI's MCR with Dermalastyl® is a new conduction solution for Microcurrent applications and can be used for face lifts and body sculpting. The potency of Elastin Infusion Therapy typically restricts treatments to a minimum 30 day interval. MCR with Dermalastyl® has been formulated to TBI specifications to be used as the conductor for a wide array of Microcurrent treatments providing a critical boost with every treatment at a reduced product cost.

TBI President Nelson Thibodeaux stated, "Our protocol and products will assist anti-aging and skincare professionals to achieve better results more quickly, painlessly and at less cost than ever before. Anyone

using Microcurrent in their practice should immediately consider the additional advantage of our MCR products. Those not using Microcurrent should consider the advantage of this treatment for their patients or clients.”
