

ComTec Releases Software for Reply Plus

Communications Technology Int'l Inc. releases audience response system control software for Fleetwood's Reply Plus® wireless voting system.

Cresskill, NJ, December 09, 2007 --(PR.com)-- Communications Technology International Incorporated (ComTec) announced today that it has released versions of its Unity and Synthesis [audience response system](#) software designed for use with Reply Plus multi-digit hardware systems.

"In today's market, a single digit polling system is adequate for about 85% of the business need" states Tom Campione, ComTec's President. He goes on to say "However, the US Market is quickly maturing and customers now frequently request feature sets that require multi-digit capability such as the prioritization of long lists of business issues."

Unity Plus software is designed for assisting the large group decision making process, while Synthesis Plus is designed for learning support and business games. With improvements in hardware design, companies owning or renting this system can now poll audiences of up to 15,500 people receiving all votes in under 5 seconds.
