

Sequoyah Paradise Releases Second Model of a Gasification Outdoor Wood Furnace to the Public

Sequoyah has started shipping a new smaller model of the outdoor wood furnace that meets the low emission requirements of states like Vermont and Maine.

Mauston, WI, December 17, 2007 --(PR.com)-- Sequoyah Paradise has released a second model of there gasification line to the general public. The new model E3300 is built the same as there Model E3400 but is smaller in size.

The E3300 is designed to be used for homes up to 5000 sq ft in size. It has been developed to be sold in states where the new emmission guidlines have been adopted. This stove is a radical improvement to outdoor wood furnaces that have been on the market for the last 30 years. It uses a patent pending process that involves using a downdraft burning method with long passes through superheated firebrick to burn up most of the emmissions releasing the energy and converting it all to usable heat.

Benifets of this include lower emmissions, no creoste, increased effcientcy, and less wood burned per btu of heat produced.

A spokesman for the company stated that this is a much more environmentally friendly stove using much less wood and making much less smoke. He however indicated that the company still does not recommend installing one of their furnaces or anyone else's for that matter within 300 feet of any neighbor, whether it is in a village or not.

More information about this stove or the company can be found at www.wdheat.com or they can be called toll free at 800-571-7002.
