

## **Metal Free Implants in Europe Meet Aesthetic Demands**

*Due to aesthetic demands in modern dental care, metal free implants are on the rise. Full ceramic implants have been successfully used in Europe for the last two decades and patients can save a fortune on their dental treatment compared to US costs.*

Mosonmagyaróvár, Hungary, April 03, 2008 --(PR.com)-- Aesthetic dental care nowadays calls metal free prosthesis “state-of-the-art”. It can be considered in many ways superior to classic metal based prosthesis as porcelain has very interesting features.

One material in particular is known as zirconium oxide (zirconia) and next to the diamond is the hardest material one can find in nature, an advantage plain dentistry makes use of and has found its way into Implantology. For many years implants have been used to replace missing tooth roots, allowing fixed and long lasting prosthesis. Patients especially value moving from a removable denture to fixed implant based prosthesis.

Implants made from zirconia have yet not had much attention, but due to new and modern manufacturing processes they now match the specifications and prices of the classic titanium implants.

One of the leading manufacturers for zirconia implants is the Germany based company Ziterion, who is now transferring its longtime titanium knowledge on to the design and production of metal free implants. Therefore metal free implants now meet the requirements of patients with the highest aesthetic demands. Zirconia implants even avoid dark gleaming in cases of a thin mucosa like known from titanium implants and address issues of allergic concerns.

Since zirconia implants are not commercially available in the US it is worth taking a glance at Europe for a treatment. In countries like Slovakia and Hungary, where the famous Semmelweis University is based, metal free implants became very popular and are available at the same medical standards, but at very favourable rates.

Dental vacation tour providers who have long term relations with surgeons and implant manufacturers, such as Dental-Offer, represent patient concerns, requirements and demands besides giving patients access to [metal free implants](#).

Aesthetic metal free prosthesis that conjures the famous “Hollywood Smile”, do not need to be expensive and are superior to classic prosthesis in many ways.
